

Creeping • Spreading • Innovative

- ◆ Repair Damage Quickly
- ◆ Lower Growth Habit
- ◆ Dark Color and Finer Texture
- ◆ Great choice for sports Fields, Golf Courses and Lawns

Turf Quality of CSI™ Rye (left) vs. Competitor's Recuperative Rye (right) in the same trial before and after mowing

RIGOROUS DISEASE SCREENING during development gives CSI™ Rye (*Lolium perenne*) the highest disease ratings of perennial ryegrasses tested to date at a research and development station in Oregon. It has excellent resistance on Crown Rust and Stripe Rust as well as excellent resistance to Winter Leaf Spot and recovers from snow molds very well with no permanent damage.

ATTRACTIVE COLOR: CSI Rye is a medium dark green color and is much darker than other perennial ryegrass marketed as recuperative. Has been tested and outperformed other top rated varieties mowed as low as ¼" (0.64cm).

UNPARALLELED TURF DENSITY for greater sod-strength. CSI has been successfully sod harvested WITHOUT netting!

EXTREMELY FINE-TEXTURED CSI Rye is noticeably finer bladed when compared to other commercial varieties. It's worth a closer look!

UTILITY PATENT awarded for its unique spreading growth habit. Continuously spreads via reproductive tillers after vernalization – as little as 7 months after seeding. Tillers formed much quicker than any other marketed recuperative ryes and regular "normal" perennial ryegrasses NEVER spread.

LESS MOWING CSI Rye's shorter growth habit allows for less mowing. While other recuperative perennial ryes grew 5" or higher (12.7cm+) between mowings in trials, CSI™ Rye grew only 3" (7.6cm). Just think of all the other things you can do with the free time you'll have on hands while your CSI Rye is looking great!

RECOMMENDED SEEDING RATE:
3-8 lbs per 1,000 ft (15-40g/m²)

Unlike regular perennial ryes, CSI produces reproductive tillers
